

WEEKLY PROBLEM

EXERCISE.

Let a function $g(x)$ be defined for all $x > 0$ by the parametric integral;

$$g(x) = \int_0^{\frac{\pi}{2}} \frac{\ln(1 + x \tan^2 \theta)}{\sin^2 \theta} d\theta$$

If another differentiable function $G(x)$ is constructed such that:

$$G(x) = \int_{\frac{1}{x}}^x g(t) dt$$

Then, the absolute value of the second derivative $G''(1)$ is equal to: ?
